ABSTRACT
An important part of the town, the medical care part, it is now burdened by traffic and pollution and the lack of the only element that helps on a long term, the „healing” – The vegetation element. This highlight the need of projects which will (re)create the relation above and offer an environment in which the patients, visitors as well as the medical staff will carry the medical act easier and with more optimism.

Therefore, the present project proposes to create a green, recreational space, on the terrace-roof of a Cluj-Napoca Diabetes Center building, dedicated to patients, visitors and medical staff as well. Besides the known benefits of a green roof, a garden of this kind will provide a healthy environment for socializing, admire nature, physical activity and loisir. Another important objective of this project is to create a visual, „palpable” link between the patients in the adjacent building, whom medical situation does not allow them to leave the hospital room, (as well the physicians who’s offices are located here) and the natural view offered by the „therapeutic” garden.

KEYWORDS
Quality of life, therapeutic garden, medical care units, green roof
